Tor:
Anonymous Communications for the Dept of Defense...and you.

Roger Dingledine
Free Haven Project
Electronic Frontier Foundation

http://tor.eff.org/

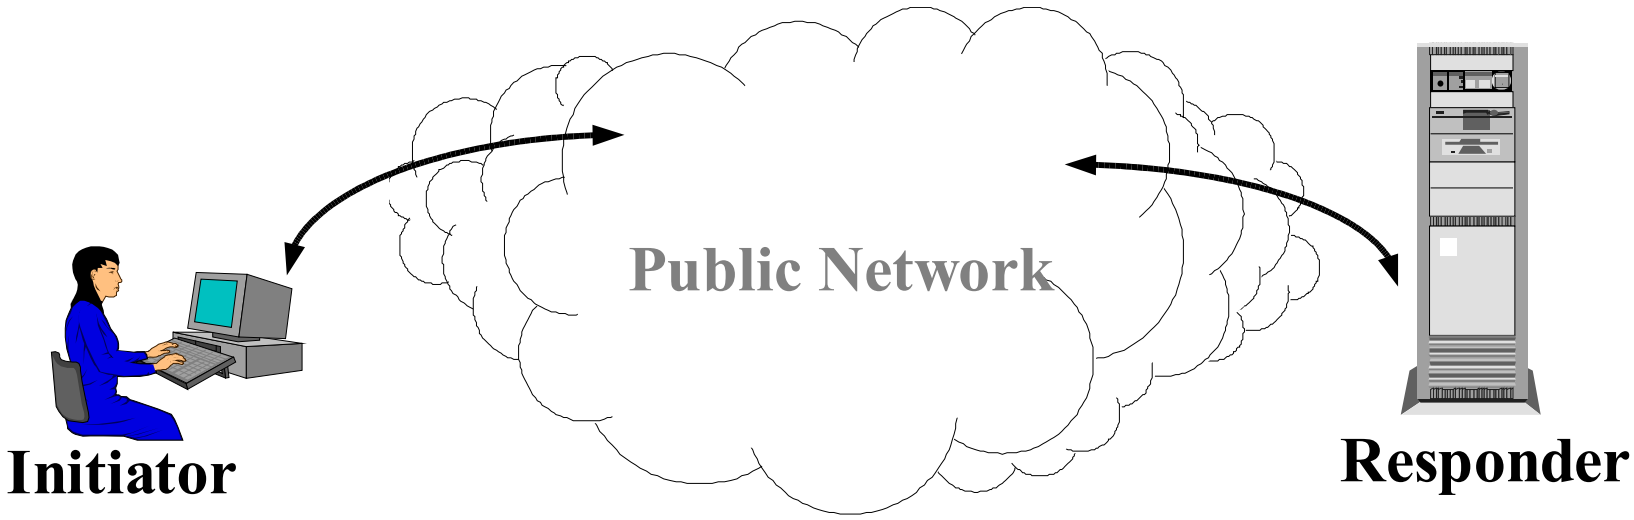
6 July 2005

Talk Outline

- Motivation: Why anonymous communication?
  - Myth 1: This is only for privacy nuts.
  - Myth 2: This stuff enables criminals.
- Tor design overview
- Hidden servers and rendezvous points
- Policy issues raised
- Open technical issues and hard problems

Public Networks are Vulnerable to Traffic Analysis

- In a Public Network (Internet):
- Packet (message) headers identify recipients
- Packet routes can be tracked



Encryption does *not* hide routing information.

Who Needs Anonymity?

- Journalists, Dissidents, Whistleblowers (indymedia, victimpower)
- Censorship resistant publishers/readers (libraries)
- Socially sensitive communicants:
  - Chat rooms and web forums for abuse survivors, people with illnesses
- Law Enforcement: (In-q-tel, Nye Kripos)
  - Anonymous tips or crime reporting
  - Surveillance and honeypots (sting operations)

Who Needs Anonymity?

- Corporations: (Google, Wal-Mart, ...)
  - Who's talking to the company lawyers? Are your employees looking at monster.com?
  - Hiding procurement suppliers or patterns
  - Competitive analysis

Who Needs Anonymity?

- You:
  - Where are you sending email (who is emailing you)
  - What web sites are you browsing
  - Where do you work, where are you from
  - What do you buy, what kind of physicians do you visit, what books do you read, ...

Who Needs Anonymity?

- Government

Government Needs Anonymity? Yes, for...

- Open source intelligence gathering
  - Hiding individual analysts is not enough
  - That a query was from a govt. source may be sensitive
- Defense in depth on open and *classified* networks
  - Networks with only cleared users (but a million of them)
- Dynamic and semitrusted international coalitions
  - Network can be shared without revealing existence or amount of communication between all parties
- Elections and voting

Anonymity Loves Company

- You can't be anonymous by yourself.
  - *Can* have confidentiality by yourself.
- A network that protects only DoD network users won't hide that connections from that network are from DoD.
- You must carry traffic for others to protect yourself.
- But those others don't want to trust their traffic to just one entity either. Network needs *distributed trust*.
- Security depends on diversity and dispersal of network.

Who Needs Anonymity?

- And yes criminals

Who Needs Anonymity?

- And yes criminals

  But they already have it.

  We need to protect everyone else.

Privacy and Criminals

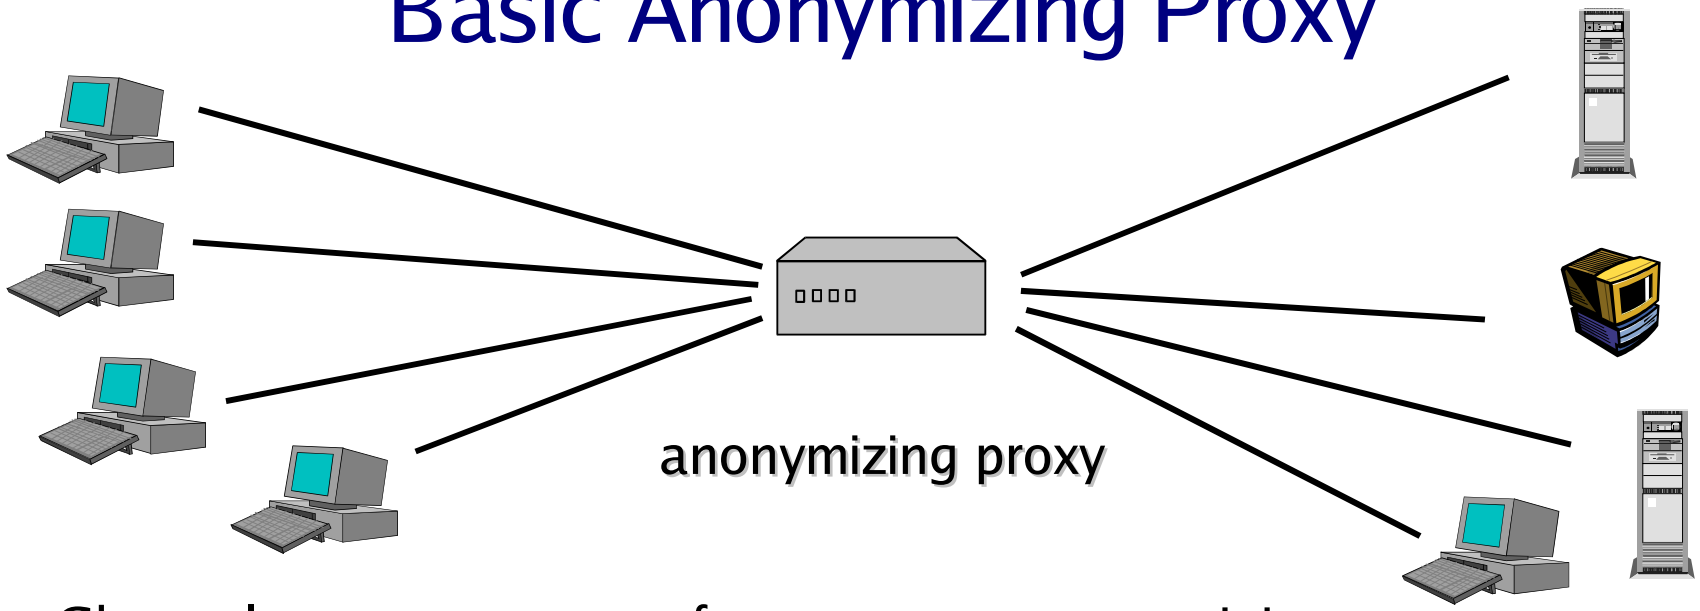
- Criminals have privacy
  - Motivation to learn
  - Motivation to buy
  - Identity theft
- Normal People, Companies, Governments, Police don't
- The worst of all possible worlds

Privacy and Hackers

- Hackers have privacy
  - Break into system
  - Destroy the logs
  - Repeat as needed
  - They don’t use or need our software
- Normal People, Companies, Governments, Police don’t
- The worst of all possible worlds

Focus of Tor is anonymity of the communication pipe,
not what goes through it

Basic Anonymizing Proxy



- Channels appear to come from proxy, not true originator
- Appropriate for Web connections, etc.:
  SSL, TLS, SSH (lower cost symmetric encryption)
- Examples: The Anonymizer
- Advantages: Simple, Focuses lots of traffic for more anonymity
- Main Disadvantage: Single point of failure, compromise, attack

Tor

The Onion Router

Tor

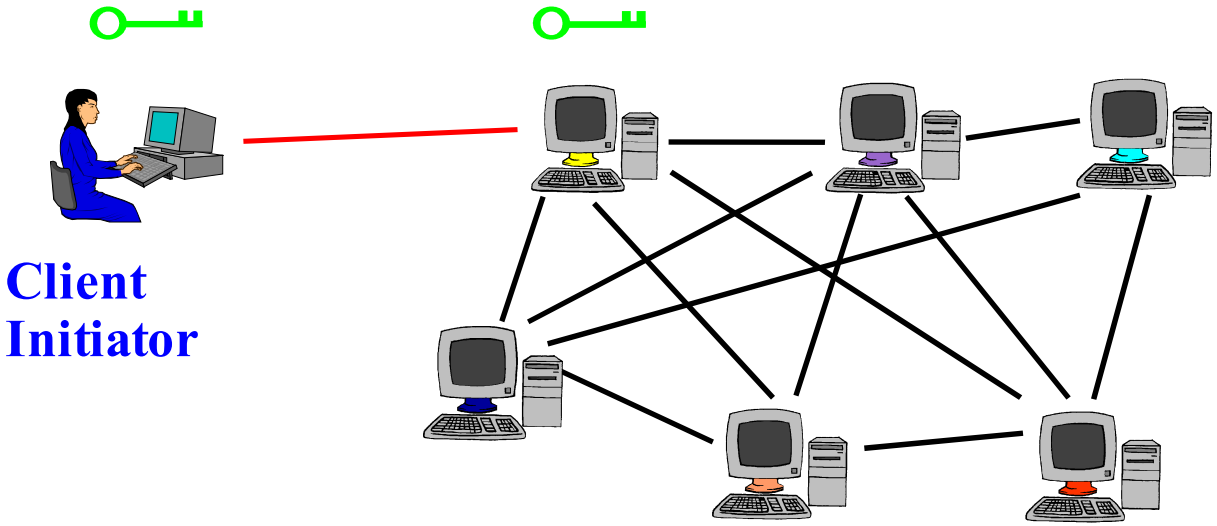
Tor's Onion Routing

Numbers and Performance

- Running since October 2003
- 250 nodes on five continents (North America, South America, Europe, Asia, Australia)
- Volunteer-based infrastructure
- Fifty thousand+ (?) users
- Nodes process 1-90 GB / day application cells
- Network has never been down

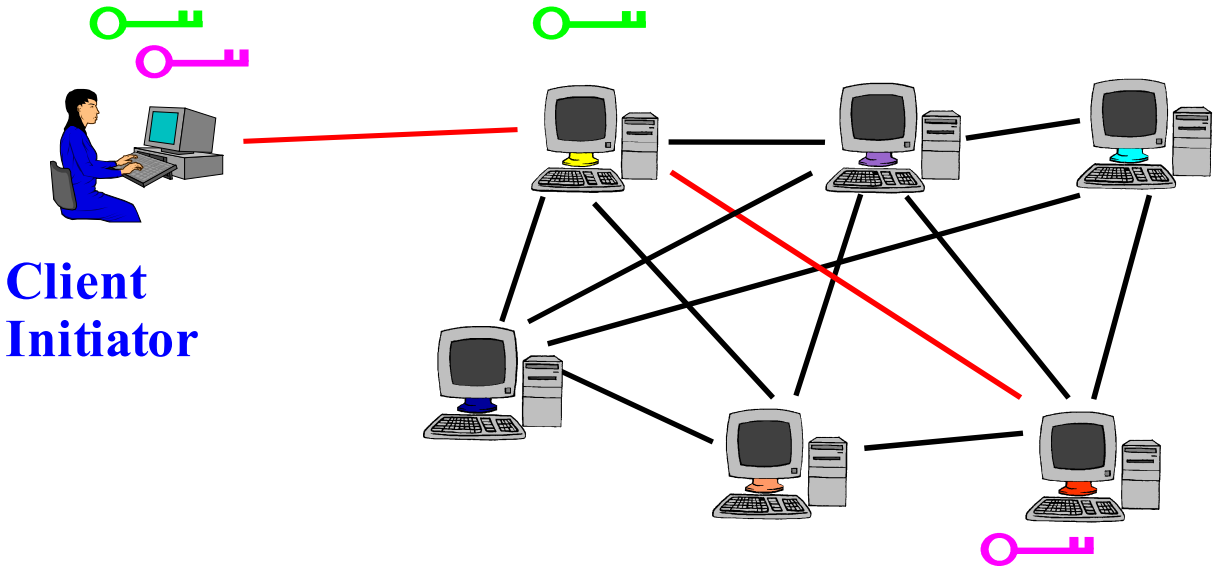
Tor Circuit Setup

- Client Proxy establishes session key + circuit w/ Onion Router 1



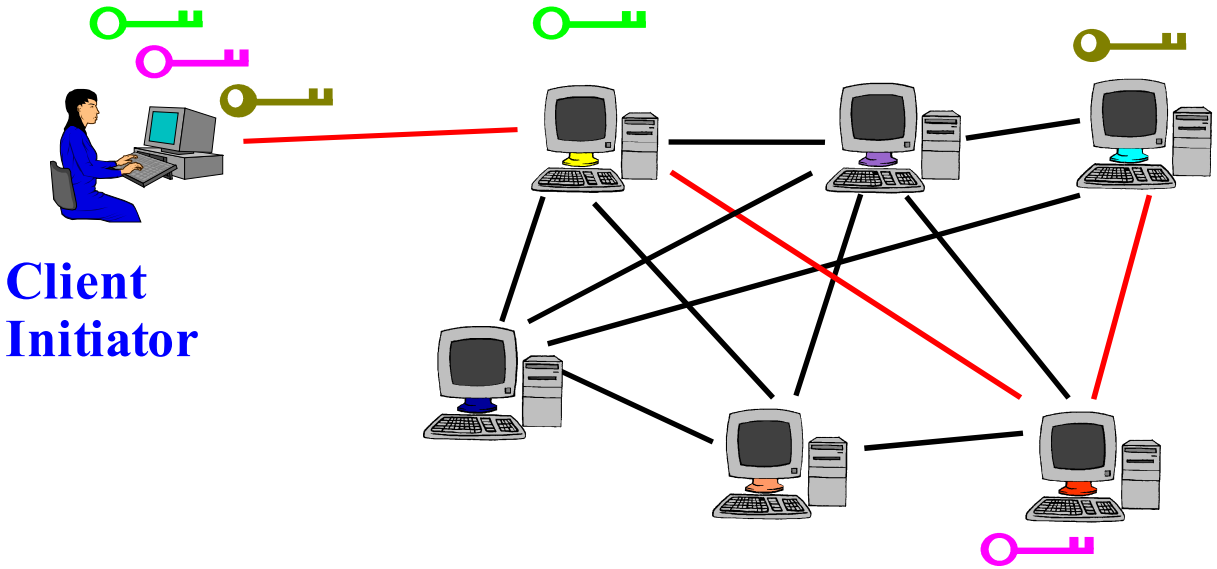
Tor Circuit Setup

- Client Proxy establishes session key + circuit w/ Onion Router 1
- Proxy tunnels through that circuit to extend to Onion Router 2



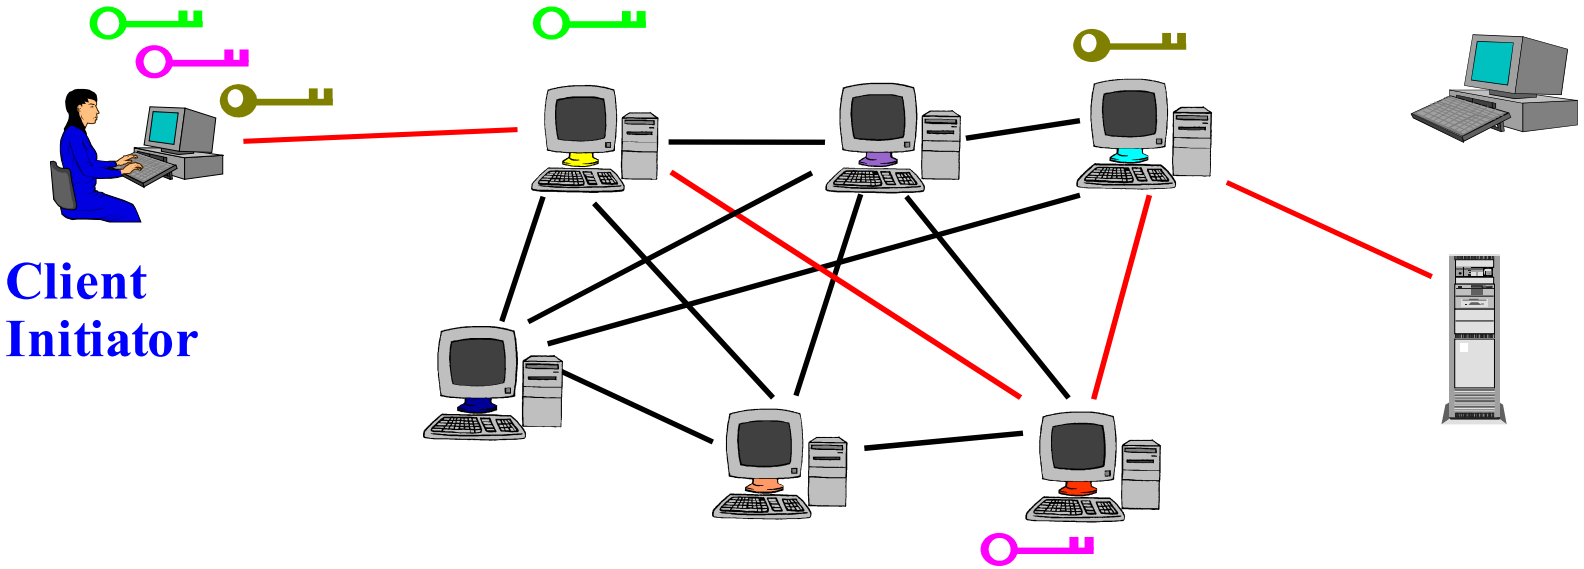
Tor Circuit Setup

- Client Proxy establishes session key + circuit w/ Onion Router 1
- Proxy tunnels through that circuit to extend to Onion Router 2
- Etc



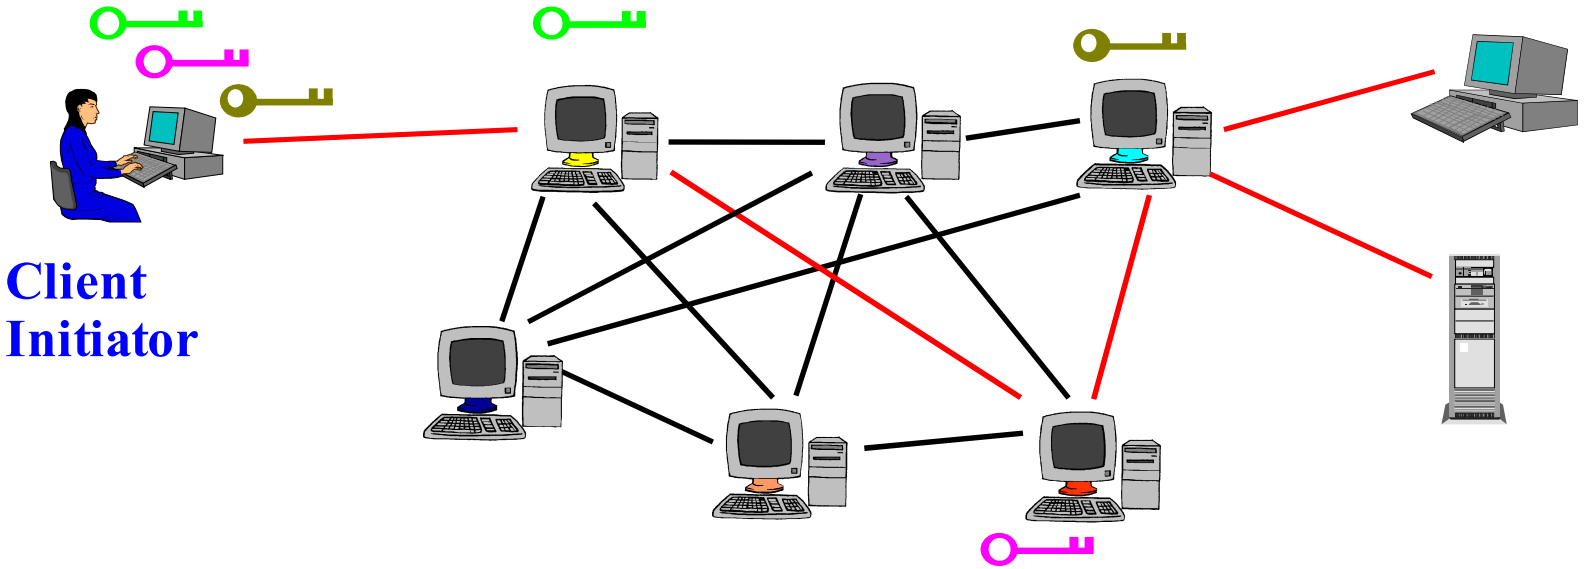
Tor Circuit Usage

- Client Proxy establishes session key + circuit w/ Onion Router 1
- Proxy tunnels through that circuit to extend to Onion Router 2
- Etc
- Client applications connect and communicate over Tor circuit



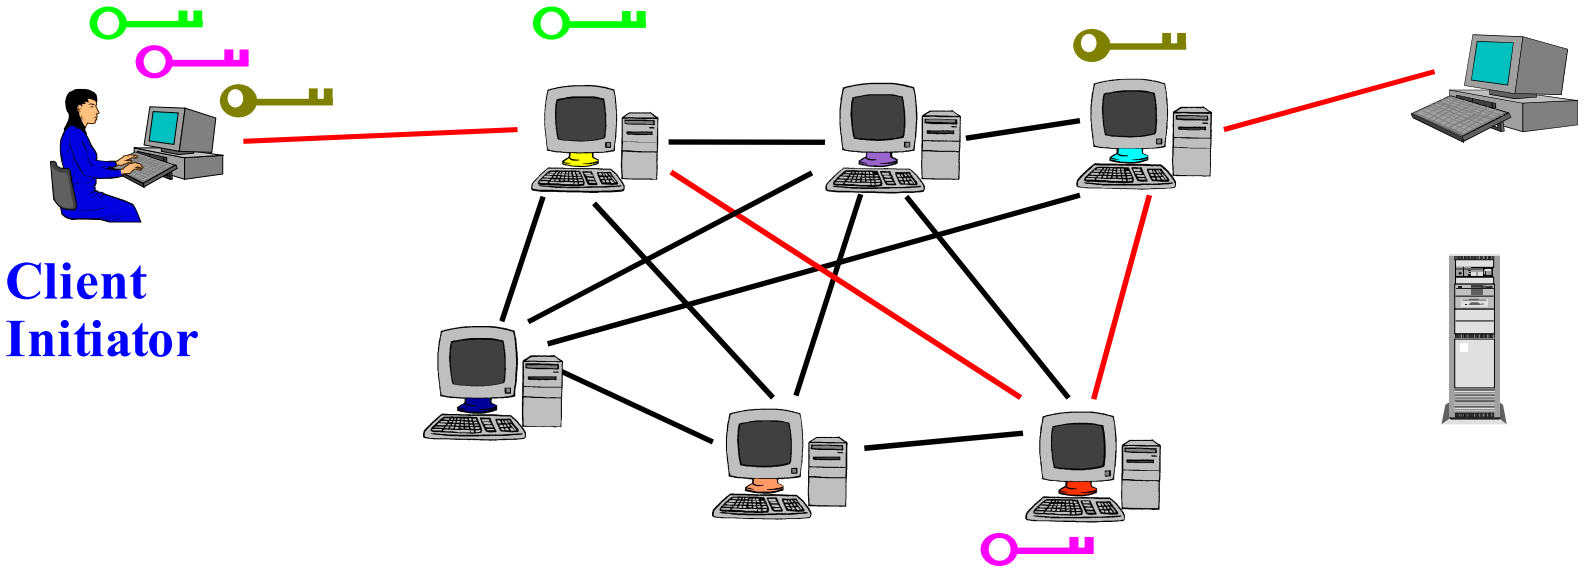
Tor Circuit Usage

- Client Proxy establishes session key + circuit w/ Onion Router 1
- Proxy tunnels through that circuit to extend to Onion Router 2
- Etc
- Client applications connect and communicate over Tor circuit



Tor Circuit Usage

- Client Proxy establishes session key + circuit w/ Onion Router 1
- Proxy tunnels through that circuit to extend to Onion Router 2
- Etc
- Client applications connect and communicate over Tor circuit



Where do I go to connect to the network?

- Directory Servers
  - Maintain list of which onion routers are up, their locations, current keys, exit policies, etc.
  - Directory server keys ship with the code
  - Control which nodes can join network
    - Important to guard against “Sybil attack” and related problems
  - These directories are cached and served by other servers, to reduce bottlenecks
  - Need to decentralize, get humans out of the loop, without letting attackers sign up 100,000 nodes.

Some Tor Properties

- Simple modular design, restricted ambitions.
  - ~40K lines of C code
  - Even servers run in user space, no need to be root
  - Flexible exit policies, each node chooses what applications/destinations can emerge from it
  - Server usability is key to adoption. Without a network, we are nothing.

Some Tor Properties

- Lots of supported platforms:

  Linux, BSD, MacOS X, Solaris, Windows, ...

Tor servers on xbox, linksys wireless routers.

- Deployment paradigm:
  - Volunteer server operators
  - No payments, not proprietary
  - Moving to a P2P incentives model

Location Hidden Servers

- Alice can connect to Bob's server without knowing where it is or possibly who he is
- Can provide servers that
  - Are accessible from anywhere
  - Resist censorship
  - Require minimal redundancy for resilience in denial of service (DoS) attack
  - Can survive to provide selected service even during full blown distributed DoS attack
  - Resistant to physical attack (you can't find them)

Get the Code, Run a Node!
(or just surf the web anonymously)

- Current code freely available (3-clause BSD license)
- Comes with a specification – the JAP team in Dresden implemented a compatible Tor client in Java
- Chosen as the anonymity layer for EU PRIME project
- One of PCWorld's Top 100 Products of 2005
- Design paper, system spec, code, see the list of current nodes, etc.
- http://tor.eff.org/

Policy issues

- Spam/proxy blacklists
- Google groups
- Wikipedia / Slashdot
- Internet Relay Chat (IRC)
- DMCA (MPAA) Harvard / Berkman
- Hotmail (FBI)

Tradeoffs

- Padding vs. no padding (mixing, traffic shaping)
- UI vs. no UI (Contest!)
- Incentives to run servers / allow exits
- Enclave-level onion routers / helper nodes
- China?
- P2P network vs. static network
