

The Tor Project, Inc.

Our mission is to be the global resource for technology, advocacy, research and education in the ongoing pursuit of freedom of speech, privacy rights online, and censorship circumvention.

What is Tor?

Online anonymity 1) open source software,
2) network, 3) protocol

Community of researchers, developers,
users, and relay operators

Funding from US DoD, Electronic Frontier
Foundation, Voice of America, Google,
NLnet, Human Rights Watch, NSF, US
State Dept, SIDA, Knight Foundation, ...

The Tor Project, Inc.

U.S. 501(c)(3) non-profit organization dedicated to the research and development of tools for online anonymity and privacy

Estimated ~800,000?
daily Tor users

Threat model: what can the attacker do?

Anonymity isn't encryption: Encryption just protects contents.

Anonymity isn't just wishful thinking...

“You can't prove it was me!”

“Promise you won't look!”

“Promise you won't remember!”

“Promise you won't tell!”

“I didn't write my name on it!”

“Isn't the Internet already anonymous?”

Anonymity serves different interests for different user groups.

Anonymity

“It's privacy!”

Private citizens

Anonymity serves different interests for different user groups.

Anonymity serves different interests for different user groups.

“It's traffic-analysis resistance!”

“It's network security!”

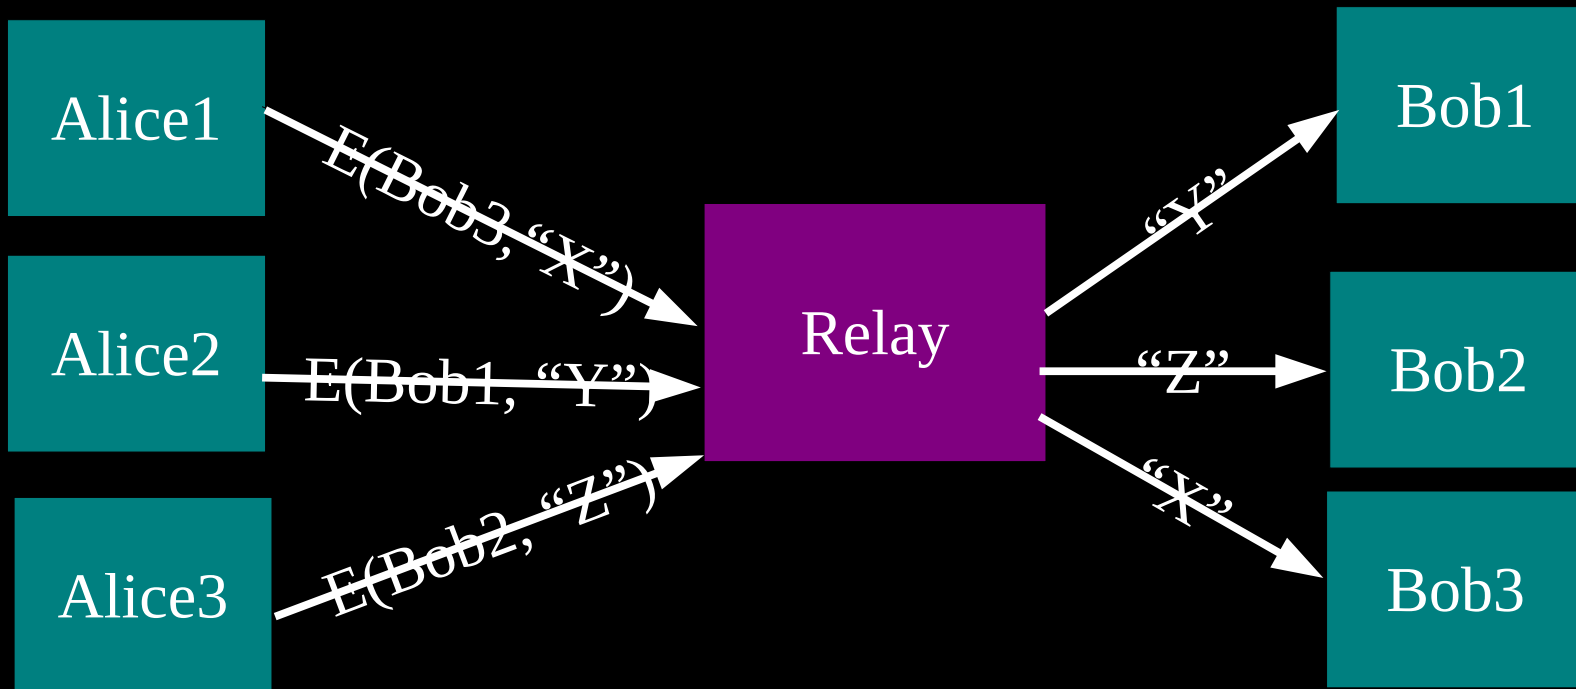

“It's privacy!”

Anonymity serves different interests for different user groups.

The simplest designs use a single relay to hide connections.

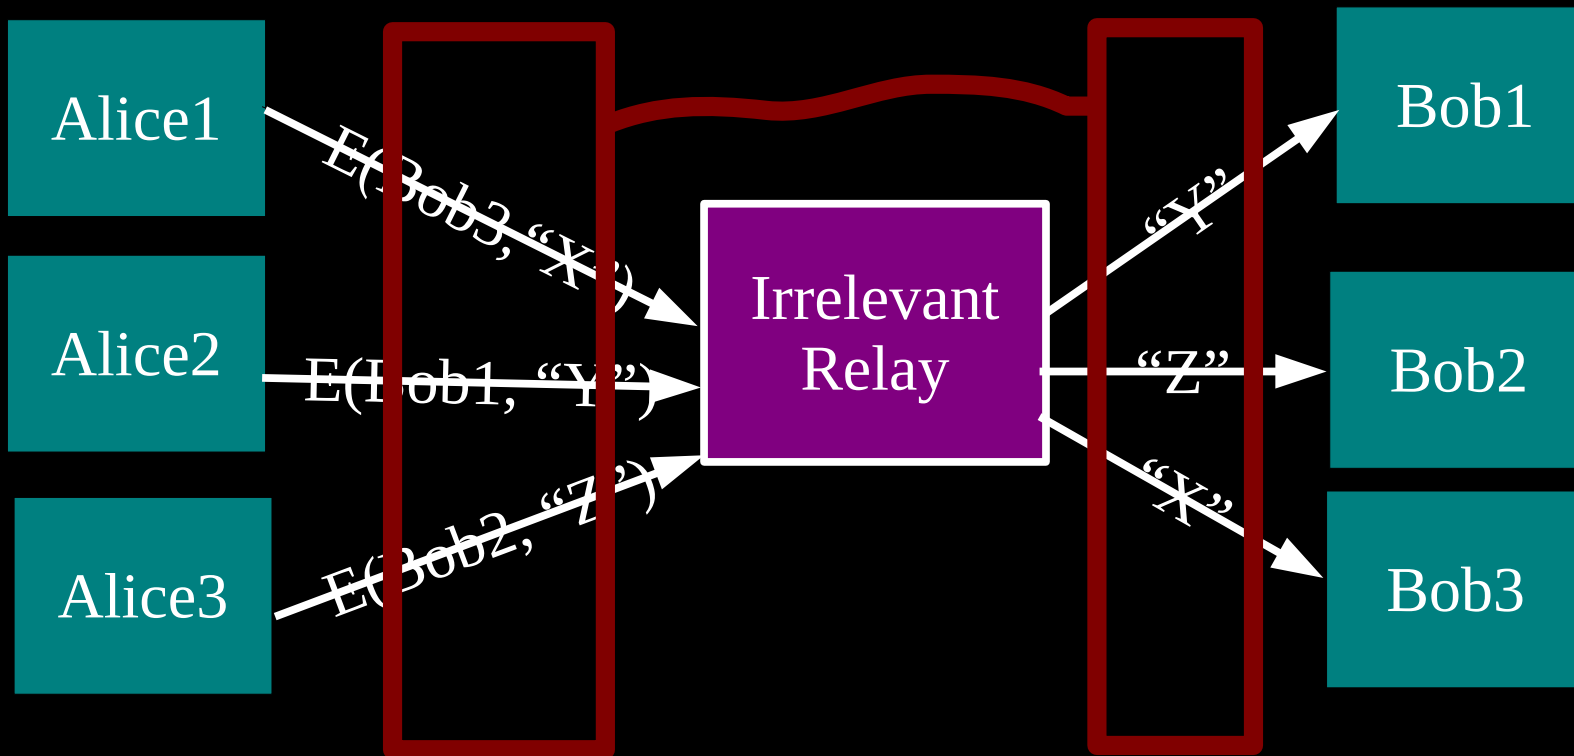

(example: some commercial proxy providers)

**But a single relay (or eavesdropper!)
is a single point of failure.**

... or a single point of bypass.

Timing analysis bridges all connections through relay \Rightarrow An attractive fat target

So, add multiple relays so that no single one can betray Alice.

**Alice makes a session key with R1
...And then tunnels to R2...and to R3**

Number of relays

The Tor Project - <https://metrics.torproject.org/>

Tor Research Home

Many people around the world are doing research on how to improve the Tor design, what's going on in the Tor network generally on attacks and defenses for anonymous communication systems. This page summarizes the resources we provide to make your Tor research more effective. The best way to reach us about research is through the [tor-assistants](#) list.

- **Data.** We've been [collecting data to learn more about the Tor network](#): how many relays and clients there are in the network, what capabilities they have, how fast the network is, how many clients are connecting via bridges, what traffic is being carried, etc. We are also developing tools to process these huge data archives and come up with [useful statistics](#). Let us know what other information you'd like to see, and we can work with you to help make sure it gets collected [safely](#) and reliably.
- **Analysis.** If you're investigating Tor, or solving a Tor-related problem, *please* talk to us somewhere along the way, the earlier the better. These days we review too many conference paper submissions that make bad assumptions about solving the wrong problem. Since the Tor protocol and the Tor network are both moving targets, measuring things without understanding what's going on behind the scenes is going to result in bad conclusions. In particular, different groups are unwittingly run a variety of experiments in parallel, and at the same time we're constantly modifying the design and our approaches. If you let us know what you're doing and what you're trying to learn, we can help you understand what variables to expect and how to interpret your results.
- **Measurement and attack tools.** We're building a [repository](#) of tools that can be used to measure, analyze, or attack Tor. Many research groups end up needing to do similar measurements (for example, change the Tor design and then see if latency improves), and we hope to help everybody standardize on a few tools and then make them better. Also, while there are some really neat Tor attacks that people have published about, it's hard to track down a complete list of what they used. Let us know if you have new tools we should list, or improvements to the existing ones. The more the merrier.
- **We need defenses too — not just attacks.** Most researchers find it easy and fun to come up with novel attack ideas for Tor systems. We've seen this result lately in terms of improved congestion attacks, attacks based on remotely measuring throughput, and so on. Knowing how things can go wrong is important, and we recognize that the incentives in the network are aligned with spending energy on designing defenses, but it sure would be great to get more attention to how to defend against attacks. We'd love to help brainstorm about how to make Tor better. As a bonus, your paper might even end up in our "countermeasures" section.
- **In-person help.** If you're doing interesting and important Tor research and need help understanding how the Tor network design works, interpreting your data, crafting your experiments, etc. we can send a Tor researcher to your department.

Tor specs

- The **specifications** aim to give developers enough information to build a compatible version of Tor:
 - Main Tor specification
 - Tor version 3 directory server specification (and older version 2 directory specification)
 - Tor control protocol specification
 - Tor rendezvous specification
 - Tor path selection specification
 - Special hostnames in Tor
 - Tor's SOCKS support and extensions
 - How Tor version numbers work
 - In-progress drafts of new specifications and proposed changes

New or returning Tor clients per day

<https://torproject.org>

Number of directory requests to directory mirror trusted

<https://torproject.org>

Attackers can block users from connecting to the Tor network

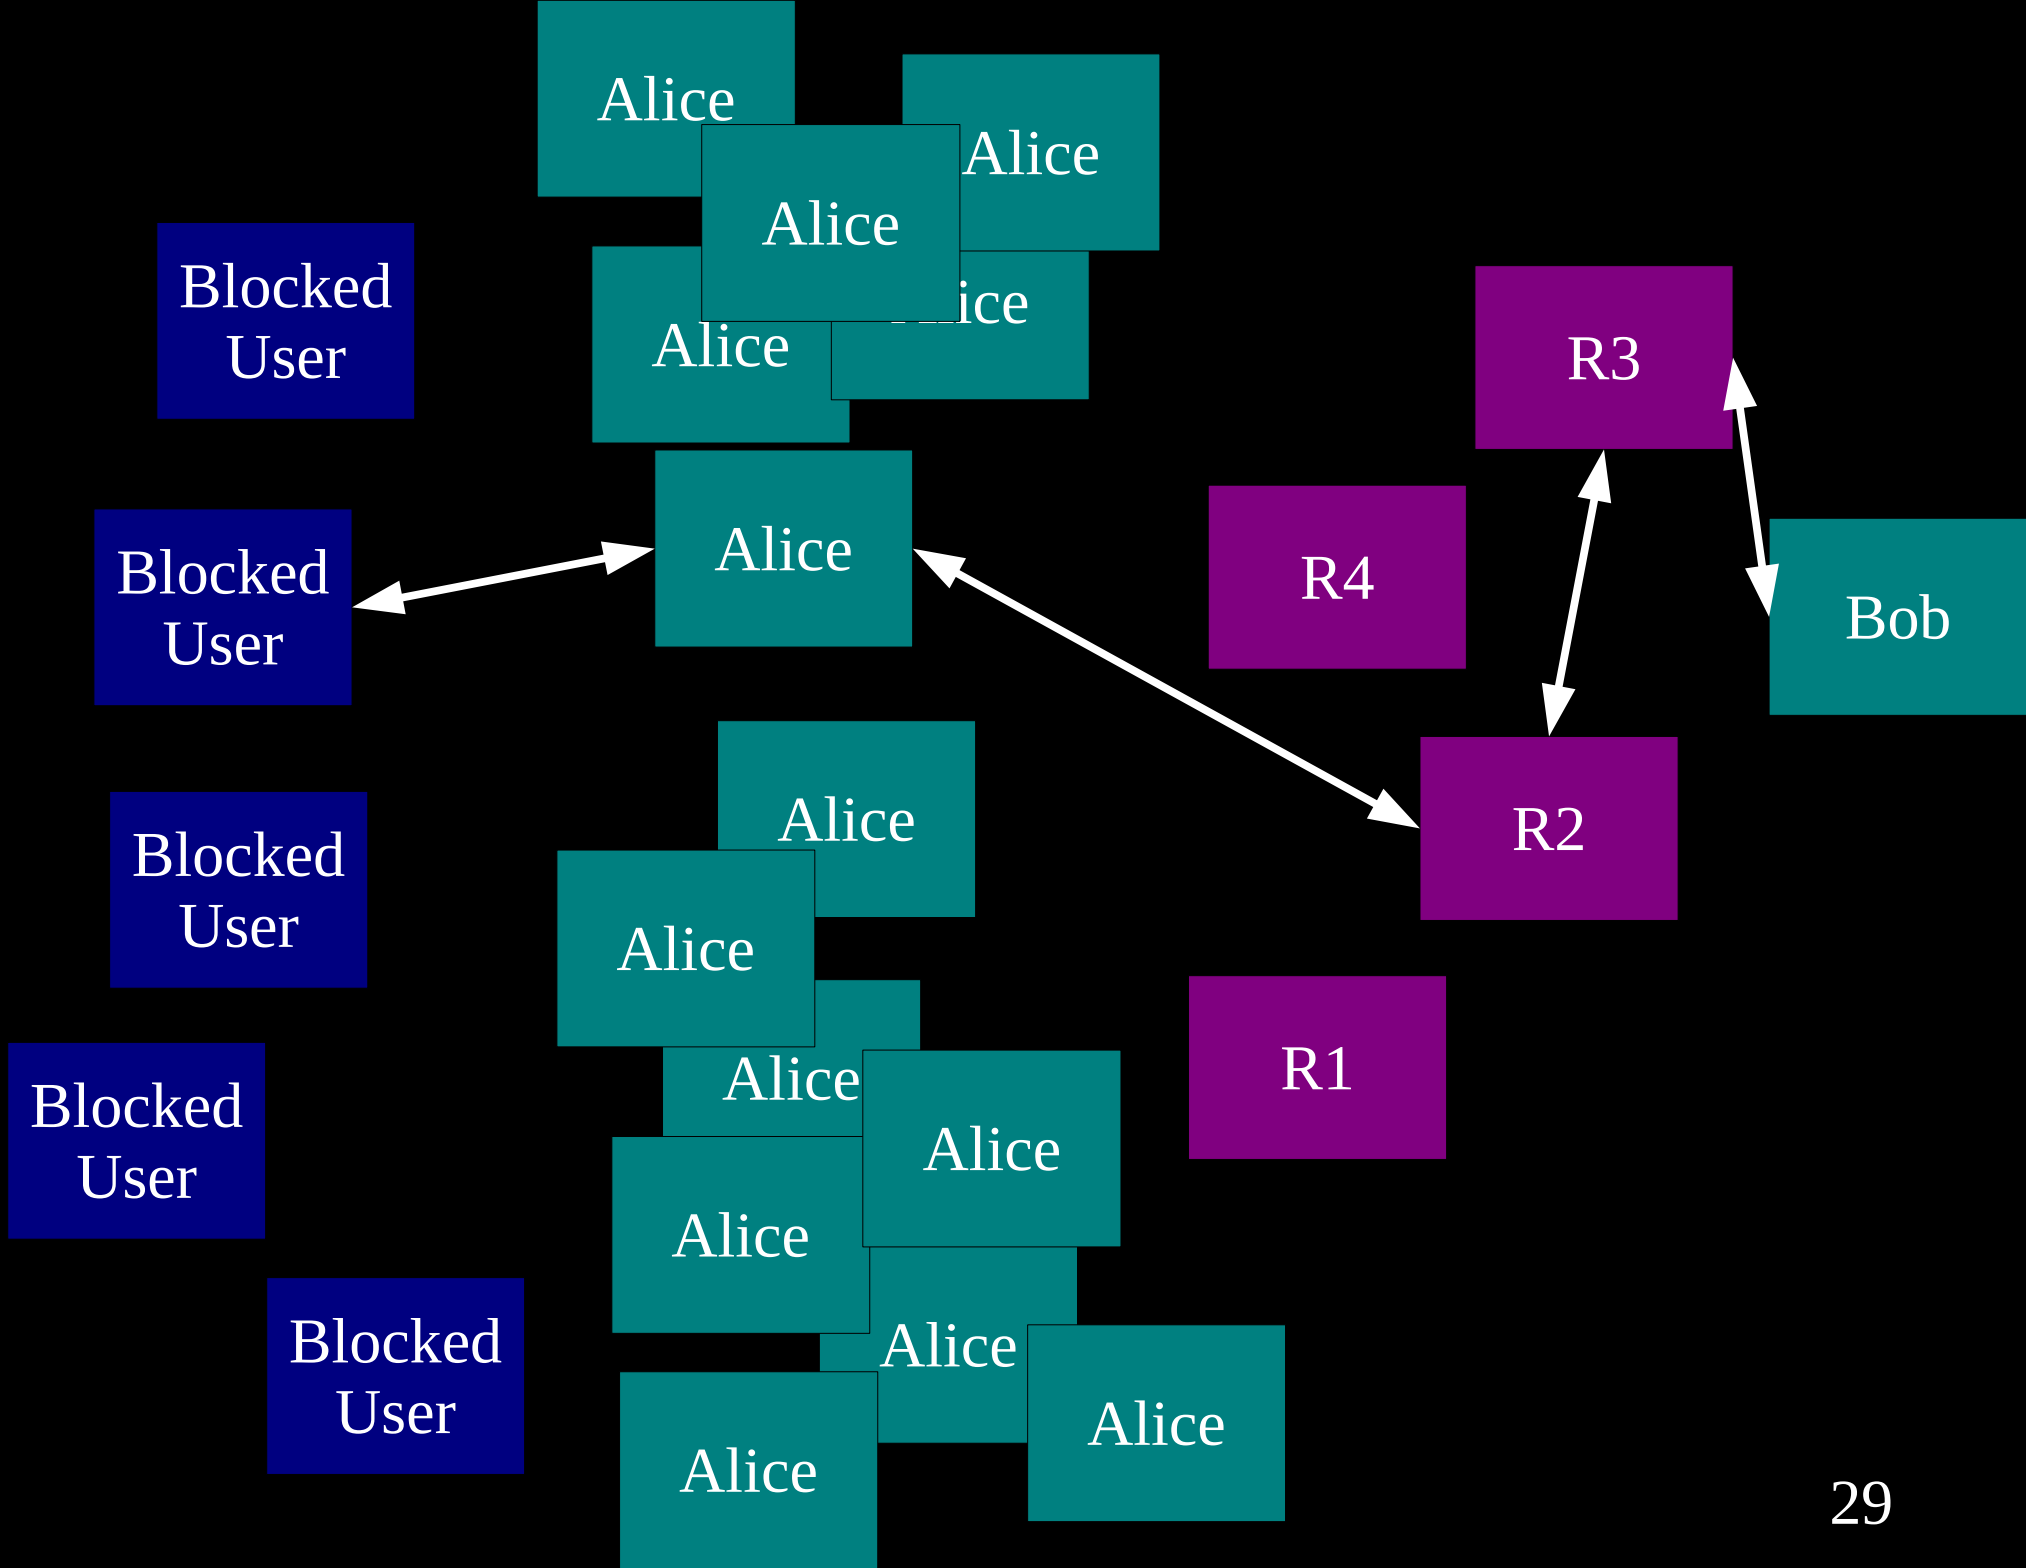

- 1) By blocking the directory authorities
- 2) By blocking all the relay IP addresses in the directory, or the addresses of other Tor services
- 3) By filtering based on Tor's network fingerprint
- 4) By preventing users from finding the Tor software (usually by blocking website)

Relay versus Discovery

There are two pieces to all these “proxying” schemes:

a **relay** component: building circuits, sending traffic over them, getting the crypto right

a **discovery** component: learning what relays are available

Number of directory requests to directory mirror trusted

- Stegotorus (SRI/CMU), http
- Skypemorph (Waterloo), Skype video
- uProxy (Google), webrtc
- Lantern (BNS), social network based
- ScrambleSuit (Karlstad), obfs-based
- Telex (Michigan/Waterloo), traffic divert

Tor's safety comes from diversity

- #1: Diversity of relays. The more relays we have and the more diverse they are, the fewer attackers are in a position to do traffic confirmation. (Research problem: measuring diversity over time)
- #2: Diversity of users and reasons to use it. 50000 users in Iran means almost all of them are normal citizens.

Tor's anonymity comes from...

- The first 100,000 users (user diversity)
- The last 1,000,000 users (end-to-end correlation resistance)
- The first 1,000 relays (location diversity)

Only a piece of the puzzle

Assume the users aren't attacked by their hardware and software

No spyware installed, no cameras watching their screens, etc

Users can fetch a genuine copy of Tor?

I CAN HAZ
FREEDOM?

“Still the King of high secure,
low latency Internet Anonymity”

Contenders for the throne:

- None

NSA/GCHQ programs that affect Tor

- Quick Ant (QFD), Quantum Insert, Foxacid
- Quantum for cookie tests (good thing we moved away from Torbutton's “toggle”)
- Remember, they can do these things even more easily to non-Tor users
- At least they can't target specific Tor users (until they identify themselves)
- “Don't worry, we never attack Americans” (!)

Perception

- DoJ's aborted study finding 3% bad content on the Tor network
- How do you compare one Snowden leak to ten true reviews on Yelp?
- BBC's Silk Road articles telling people how to buy drugs safely

Trip report: Tor trainings for the Dutch and Belgian police

[View](#)[Edit](#)

Posted February 5th, 2013 by [arma](#) in [internet censorship](#), [law enforcement](#), [trip report](#)

In January I did Tor talks for the Dutch regional police, the Dutch national police, and the Belgian national police. Jake and I also did a brief inspirational talk at [Bits of Freedom](#), as well as the closing keynote for the Dutch [National Cyber Security Centre's](#) yearly [conference](#).

You may recall that one of my side hobbies lately has been teaching law enforcement about Tor — see my previous entries about [teaching the FBI about Tor](#) in 2012 and visiting the [Stuttgart](#) detectives in 2008 back when we were discussing data retention in Germany. Before this blog started I also did several Tor talks for the US DoJ, and even one for the Norwegian [Kripos](#).

Now is a good time to talk to the Dutch police, first because they're still smarting from the [DigiNotar disaster](#) in 2011, but second because of their 2012 ambitions to [legalize](#) breaking into foreign computers when they aren't sure what country they're in. (I say legalize because [they already did it!](#))

Below are some discussion points that made an impression on me.

- I started the trip with a [talk](#) to about 80 people from the Dutch regional police. Apparently each regional police group has basically one cybercrime person, and pretty much all of them came to learn about Tor. These are the people who advise their police groups about how to handle Tor cases, so they're exactly the ones who need to know about services like [ExoneraTor](#). (Afterwards, one of the national police thanked me heartily for teaching the regional police about Tor, since it makes *his* job easier.)
- One issue that came up repeatedly during the talks: what if a bad guy runs a Tor exit relay to provide plausible deniability when somebody shows up as his door? My first thought is that anybody who runs a Tor exit relay in order to attract *less* attention from

Financial Review

Tor's fiscal 2012 marked another year of financial improvement. The organization has seen steady revenue growth since its inception. Significant milestones of \$1,253,241 in 2009, \$1,574,119 in 2010, and \$1,875,000 in 2011. Tor has reached new heights in 2012 with over \$2,000,000 in revenue. Fiscal 2012 results also provided a new financial record: The Tor Project Inc. has reached a new high in revenue. Revenue growth was driven by diversity in

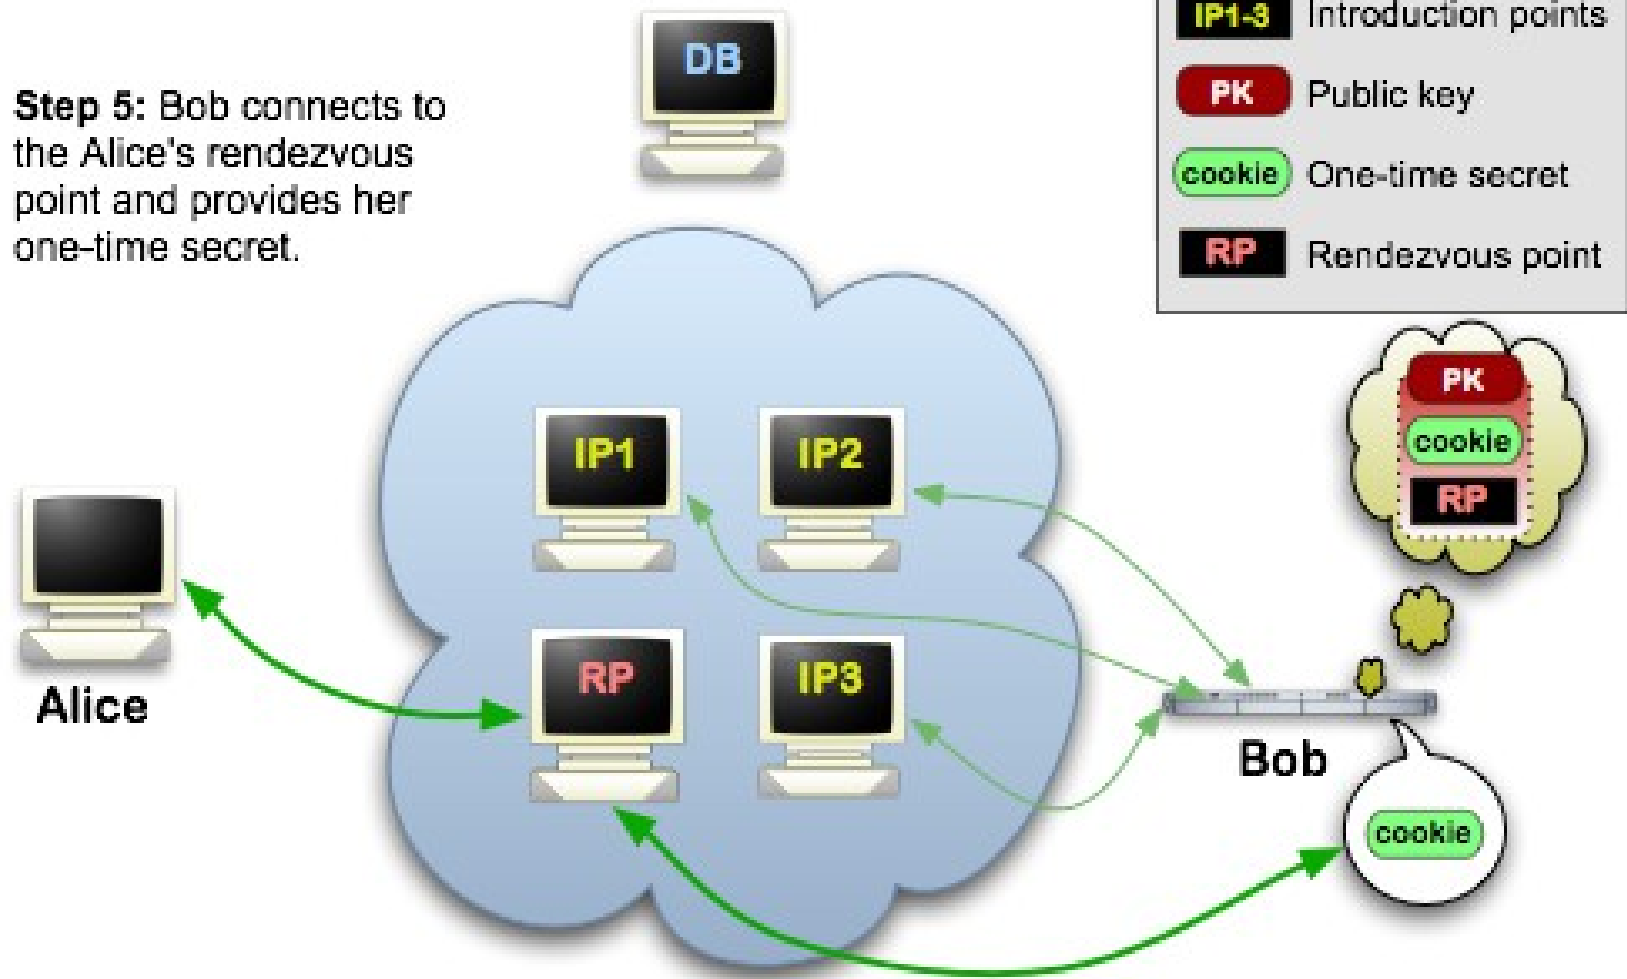

U.S. government federal funding from the Department of Justice, the State Department, the National Science Foundation, the Swedish International Development Cooperation Agency, and private

Fiscal responsibility is important to maintain financial stability, and Tor is committed to being sufficient to maintain operations. Tor is proud to report that, since

Tor Hidden Services: 5

Step 5: Bob connects to the Alice's rendezvous point and provides her one-time secret.

High-profile hidden services

The media has promoted a few hot topics:

- WikiLeaks (~2010)
- Farmer's market (pre-2013)
- Freedom Hosting (2013)
- Silk Road (2013)

There are many more (eg: many GlobaLeaks deployments, etc) which aren't well known by the media (yet).

So what should Tor's role in the world be?

- Can't be solely technical (anymore, if it ever could have been)
- But technical is what we're best at (at least, historically)
- Remember how important diversity of users is

Three ways to destroy Tor

- 1) Legal / policy attacks
- 2) Make ISPs hate hosting exit relays
- 3) Make services hate Tor connections
 - Yelp, Wikipedia, Google, Skype, ...

Directly connecting users

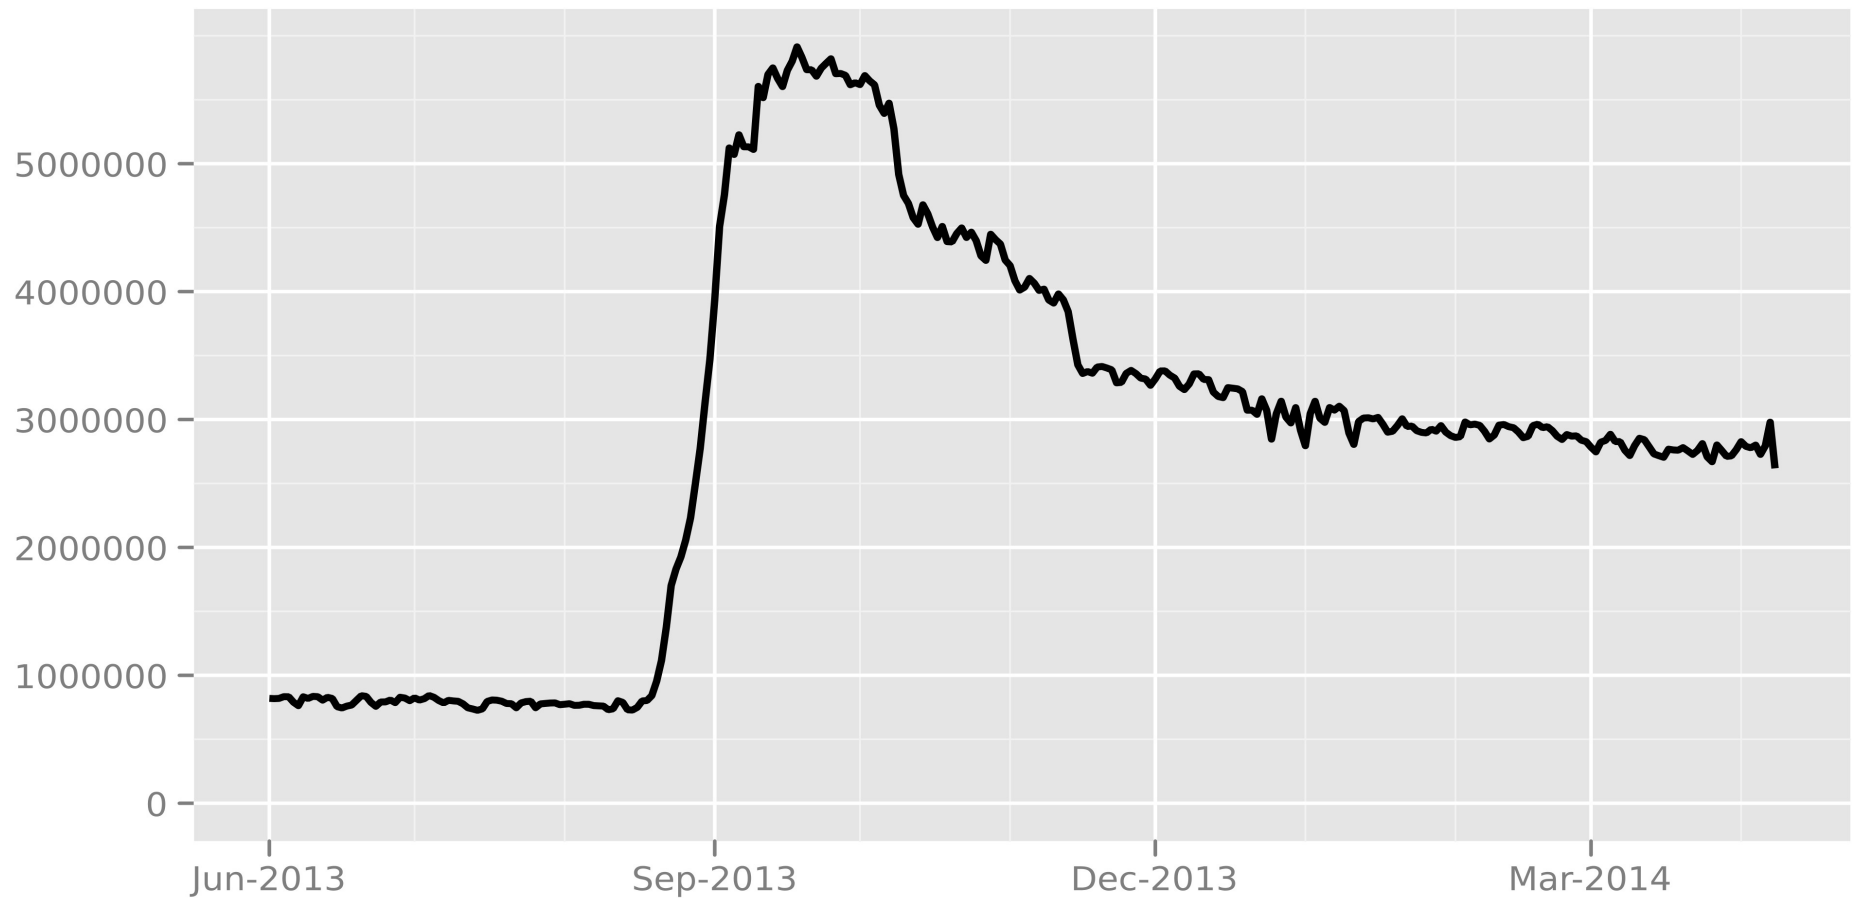

The Tor Project - <https://metrics.torproject.org/>

Botnet

- Some jerk in the Ukraine signed up 5 million bots as Tor clients (not relays)
- Our scalability work paid off!
- Good thing it wasn't malicious.
- Ultimately it didn't work: everybody noticed, and Microsoft has been cleaning up the bots

Number of daily Tor users

Directly connecting users

The Tor Project - <https://metrics.torproject.org/>

So what's next?

- “Tor: endorsed by Egyptian activists, Wikileaks, NSA, GCHQ, Chelsea Manning, Snowden, ...”
- Different communities like Tor for different reasons.

Directly connecting users from Turkey

The Tor Project - <https://metrics.torproject.org/>

Tor Browser Bundle 3.x

- Deterministic Builds
- “Tor launcher” extension, no Vidalia
- Asks if you want bridges first
- Local homepage, so much faster startup
- Security slider (for e.g. JavaScript)
- Privacy fixes, e.g. font enumeration

- New Identity
- Cookie Protections
- Preferences...
- About Torbutton...
- Open Network Settings...
